THERMALLY MODIFIED WOOD COLLECTION
Interior & Exterior Cladding
Thermally Modified Collection is beautifully finished wood cladding that’s designed to be seen. Not only does it have great curb appeal, it’s more durable than natural exterior wood cladding because it resists rot and insects. The innovative thermal modification process stabilizes the lumber it’s made from, making it less vulnerable to cupping, shrinking and seasonal expansion and contraction cycles. This low-maintenance tongue and groove wood cladding installs easily with common fasteners. The tongue and groove profiled planks can be installed on both interior and exterior walls and ceilings and in a variety of applications. What’s more, this siding collection is available in natural or in a variety of on-trend colors, all which feature a one-of-a-kind brushed finish.

**NATURALLY MADE**
Thermally modified wood is an all-natural process that incorporates both heat and steam to alter the wood fiber at a cellular level. Our wood is manufactured by heating the wood to 320º F while protecting it with steam. The steam also affects the natural chemical changes taking place. As a result of the heat and steam treatment, thermally modified wood is created. The result produces a very stable board without the use of chemicals. The wood is richer in color, dimensionally stable, and its thermal insulation properties are improved.

**PREFINISHED**
Thermally Modified Collection prefinished (painted) cladding greatly reduces the variables weather may have on the finish and eliminates the varying moisture levels that adversely affect unfinished siding products stored outdoors before being finished. By keeping products indoors and inspecting them prior to finish, we can ensure the most consistent and highest quality finish available.
THERMALLY MODIFIED WOOD COLLECTION

Interior & Exterior Cladding

KEY FEATURES
• Domestically sourced and manufactured
• All-natural heat wood preservation process
• Naturally resistant to rot and insects
• Very stable with minimal cupping or warping
• Natural wood finish or colorfully prepainted
• Common patterns that are easy to install
• End matched profile for faster install and less waste

CLADDING PROFILES

T&G nickel gap reveal end-matched

WP4/T&G V-groove joint and end-matched (special order)

Widths 1x6, 1x8 | Thickness 11/16 in | Lengths 8, 10, 12, 14, 16 ft
Matching trim and fascia are also available.
